24V 2A 500kHz synchronous Buck Converter

Features

- Wide Input Voltage from 4.5V to 24V
- 2A Continuous Output Current
- Adjustable Output Voltage from 0.807V to 13V
- Integrated Low Rds(on) MOSFETs
- Fixed 500kHz Switching Frequency
- Over-Temperature Protection
- Current-Limit Protection with HICCUP Mode
- Small TSOT-23-8A Package
- Lead Free and Green Devices Available (RoHS Compliant)

General Description

JTMA7314 is a 2A synchronous buck converter with integrated low Rds(on) power MOSFETs. The JTMA7314 design with a current-mode control scheme, can convert wide input voltage of 4.5V to 24V to the output voltage adjustable from 0.807V to 13V to provide excellent output voltage regulation.

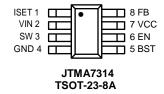

The JTMA7314 is also equipped with Under-voltage lockout, soft-start, over-temperature and current-limit protection into a single package.

This device, available TSOT-23-8A, provides a very compact system solution external components and PCB area.

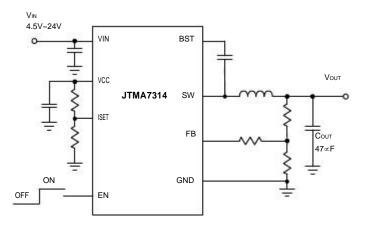

Applications

- LCD Monitor/TV
- Set-Top Box
- DSL, Switch HUB
- Notebook Computer

Pin Configuration

Simplified Application Circuit

JIATAIMU reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

Ordering and Marking Information

JTMA7314		Assembly Material Handling Code Temperature Range Package Code	Package Code AZ: TSOT-23-8A Temperature Range I: -40 to 85 °C Handling Code TR: Tape & Reel Assembly Material G: Halogen and Lead Free Device	
JTMA7314 AZ :	W14X		X - Date Code	

Note: JIATAIMU lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. JIATAIMU lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. JIATAIMU defines "Green" to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
Vin	VIN Supply to GND Voltage	-0.3 ~ 27	V
Vsw	SW to GND Voltage	-0.3 ~ 27	V
V _{BST-SW}	BST to SW Voltage	-0.3 ~ 6	V
	ISET, EN, VCC and FB to GND Voltage	-0.3 ~ 6	V
TJ	Junction Temperature	150	°C
Тѕтѕ	Storage Temperature	-65 ~ 150	°C
Tsdr	Maximum Lead Soldering Temperature (10 Seconds)	260	°C

Note1: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability

Thermal Characteristics

Symbol	Parameter	Typical Value	Unit
AL	Junction-to-Ambient Resistance in Free Air (Note 2)	220	°C/W

Note 2: 🖟 is measured with the component mounted on a high effective thermal conductivity test board in free air.

Recommended Operating Conditions (Note 4)

Symbol	Parameter	Range	Unit

Pin Description

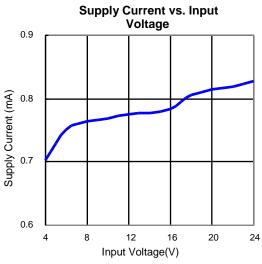

Р	IN	FUNCTION			
NO.	NAME				
1	ISET	Connect to a voltage supply through 2 resistor dividers to force the JTMA7314 into non-synchronous mode under light loads. Pull ISET pin to VCC to force the JTMA7314 into CCM.			
2	VIN	Power Input. VIN supplies the power to the control circuitry, gate driver. Connecting a ceramic bypass capacitor and a suitably large capacitor between VIN and GND eliminates switching noise and voltage ripple on the input to the IC.			
3	SW	Power Switching Output. SW is the Source of the N-Channel power MOSFET to supply power to the output LC filter.			
4	GND	Signal and power ground.			
5	BST	High-Side Gate Drive Boost Input. BS supplies the voltage to drive the high-side N-channel MOSFET. At least			
6	EN	Enable Input. EN is a digital input that turns the regulator on or off. EN threshold is 1.4V with 0.2V hysteresis. Pull up with 100k& resistor for automatic startup.			
7	VCC	Bias Supply. Decouple with a 0.1∞F capacitor or higher is recommended.			
8	FB	Output feedback Input. The IC senses the feedback voltage via FB and regulates FB voltage at 0.807V. Connecting FB with a resistor-divider from the converter's output to set the output voltage.

Block Diagram

Typical Application Circuit

Function Description

Main Control Loop

The JTMA7314 is a constant frequency, synchronous rectifier and current-mode switching regulator. In normal operation, the internal upper power MOSFET is turned on each cycle. The peak inductor current at which ICMP turn off the upper MOSFET is controlled by the voltage on the COMP node, which is the output of the error amplifier (EAMP). An external resistive divider connected between VOUT and ground allows the EAMP to receive an output feedback voltage V_{FB} at FB pin. When the load current increases, it causes a slightly decrease in V_{FB} relative to the 0.807V reference, which in turn causes the COMP voltage to increase until the average inductor current matches the new load current.

Enable/Shutdown

Driving EN to the ground places the JTMA7314 in shutdown mode. When in shutdown, the internal power MOSFETs turn off, all internal circuitry shuts down and the quiescent supply current reduces to $1 \times A$ typical.

Under Voltage Lockout (UVLO)

An under-voltage lockout function prevents the device from operating if the input voltage on VIN is lower than approximately 3.9V. The device automatically enters the shutdown mode if the voltage on VIN drops below approximately 3.9V. This under-voltage lockout function is implemented in order to prevent the malfunctioning of the converter.

Soft-Start

The JTMA7314 has a built-in soft-start to control the output voltage rise during start-up. During soft-start, an internal ramp voltage, connected to the one of the positive inputs of the error amplifier, raises up to replace the reference voltage (0.807V typical) until the ramp voltage reaches the reference voltage. Then, the voltage on FB regulated at reference voltage.

Over-Current-Protection and Hiccup

The JTMA7314 has a cycle-by-cycle over-current limit when the inductor current peak value exceeds the set current limit threshold. Meanwhile, the output voltage drops until FB is below the Under-Voltage (UV) threshold below the reference. Once UV is triggered, the JTMA7314 enters hiccup mode to periodically restart the part. This protection mode is especially useful when the output is dead-shorted to ground. The average short circuit current is greatly reduced to alleviate thermal issues and to protect the regulator. The JTMA7314 exits the hiccup mode once the over-current condition is removed.

Over-Temperature Protection (OTP)

The over-temperature circuit limits the junction temperature of the JTMA7314. When the junction temperature exceeds 150°C, a thermal sensor turns off the both power MOSFETs, allowing the devices to cool. The thermal sensor allows the converters to start a soft-start process and regulate the output voltage again after the junction temperature cools by 30°C. The OTP is designed with a 30°C hysteresis to lower the average Junction Temperature (TJ) during continuous thermal overload conditions, increasing the lifetime of the device.

Over-Voltage Protection (OVP)

The over-voltage function monitors the output voltage by FB pin. Once the FB voltage exceeds 120% of the reference voltage, the over-voltage protection comparator forces the low-side MOSFET on. This action actively pulls down the output voltage to prevent the end device be damage. As soon as the output voltage is below 105% of the reference voltage, the low-side MOSFET off and the OVP comparator is disengaged. The chip restores its normal operation.

JTMA7314

Function Description

Frequency Foldback

The foldback frequency is controlled by the FB voltage. When the output is shortened to the ground, the frequency of the oscillator will be reduced to $0.25~x~F_{\text{SW}}$. This lower frequency allows the inductor current to safely discharge, there by preventing current runaway. The oscillator's frequency will gradually increase to its designed rate when the feedback voltgae on FB again approaches 0.807V.

Application Information

Input Capacitor Selection

Because buck converters have a pulsating input current, a low ESR input capacitor is required. This results in the best input voltage filtering, minimizing the interference with other circuits caused by high input voltage spikes. Also, the input capacitor must be sufficiently large to stabilize the input voltage during heavy load transients. For good input voltage filtering, usually a $22 \infty F$ input capacitor is sufficient. It can be increased without any limit for better input-voltage filtering. Ceramic capacitors show better performance because of the low ESR value, and they are less sensitive against voltage transients and spikes compared to tantalum capacitors. Place the input capacitor as close as possible to the input and GND pin of the device for better performance.

Inductor Selection

For high efficiencies, the inductor should have a low DC resistance to minimize conduction losses. Especially at high-switching frequencies, the core material has a higher impact on efficiency. When using small chip inductors, the efficiency is reduced mainly due to higher inductor core losses. This needs to be considered when selecting the appropriate inductor. The inductor value determines the inductor ripple current. The larger the inductor value, the smaller the inductor ripple current and the lower the conduction losses of the converter. Conversely, larger inductor values cause a slower load transient response. A reasonable starting point for setting ripple current, \square L, is 40% of maximum output current. The recommended inductor value can be calculated as below:

$$L \ \epsilon \ \frac{ \bigvee \ \ \ }{ Fsw \oplus \Box l L }$$

$$IL(MAX) = IOUT(MAX) + \frac{1}{2} \Box l L$$

To avoid saturation of the inductor, the inductor should be rated at least for the maximum output current of the converter plus the inductor ripple current.

Output Voltage Setting

In the adjustable version, the output voltage is set by a resistive divider. The external resistive divider is connected to the output, allowing remote voltage sensing as shown in "Typical Application Circuits". The output voltage can be calculated as below:

$$Vout = VREF \oplus \left\{ \left[1 + \frac{R1}{R2} \right] = 0.807 \oplus \left[\left[1 + \frac{R1}{R2} \right] \right] \right\}$$

Output Capacitor Selection

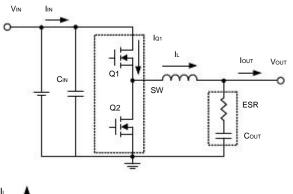

The current-mode control scheme of the JTMA7314 allows the use of tiny ceramic capacitors. The higher capacitor value provides the good load transients response. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. If required, tantalum capacitors may be used as well. The output ripple is the sum of the voltages across the ESR and the ideal output capacitor.

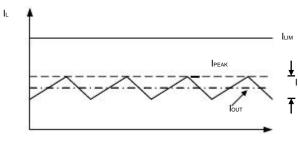

When choosing the input and output ceramic capacitors, choose the X5R or X7R dielectric formulations. These dielectrics have the best temperature and voltage characteristics of all the ceramics for a given value and size.

Application Information

OutPut Capacitor Selection

When choosing the input and output ceramic capacitors, choose the X5R or X7R dielectric formulations. These dielectrics have the best temperature and voltage characteristics of all the ceramics for a given value and size.

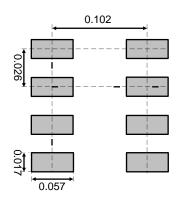

Layout Consideration

For all switching power supplies, the layout is an important step in the design; especially at high peak currents and switching frequencies. If the layout is not carefully done, the regulator might show noise problems and duty cycle jitter.

- 1. The input capacitor should be placed close to the VIN and GND. Connecting the capacitor and VIN/GND with short and wide trace without any via holes for good input voltage filtering. The distance between VIN/GND to capacitor less than 2mm respectively is recommended.
- To minimize copper trace connections that can inject noise into the system, the inductor should be placed as close as possible to the SW pin to minimize the noise coupling into other circuits.

- 3. The output capacitor should be place closed to converter VOUT and GND.
- 4. Since the feedback pin and network is a high impedance circuit the feedback network should be routed away from the inductor. The feedback pin and feedback network should be shielded with a ground plane or trace to minimize noise coupling into this circuit.
- 5. A star ground connection or ground plane minimizes ground shifts and noise is recommended.
